1. Field of the Invention The present invention relates to a semiconductor device and a method for fabricating the same, and more particularly to a semiconductor device having a multilayer interconnection structure and a method for fabricating the same.

2. Description of the Related Art As the performance of an integrated circuit is enhanced, its gate length is required to be shortened. With the shrinkage of the gate length, a critical dimension (CD) of the gate of the transistor becomes reduced and a short channel effect (SCE) may occur. When SCE occurs, a threshold voltage of the transistor is lowered, and a driving current of the transistor is reduced, thereby causing malfunction of the transistor. To solve this problem, a technique for reducing the CD of the gate at the same time as enhancing the performance of a device by filling polysilicon in the gate has been developed. However, when a thickness of the polysilicon gate is reduced, the gate is difficult to be controlled by a doping impurity, thereby degrading an operation performance of the transistor. To overcome this problem, a process for depositing a polycide on a gate or a silicon gate has been suggested. Referring to FIG. 1, a gate insulation layer 10, a pad oxide layer 12, and
