Cracked software was collected from software cracking groups and warez, most of the. wasatch. v.5.5-23 (English) Warez. - 0.31 KB.Field of the Invention The present invention relates to a switching power supply that has a high power-supply breakdown voltage. Description of Related Art A power supply that is used in an electronic device has conventionally been required to have a high power-supply breakdown voltage because, for example, the device is provided in a case exposed to the environment. A switching power supply conventionally adopts a so-called island topology in which a switching element such as an IGBT (insulated gate bipolar transistor) or FWD (field-effect transistor) is connected to a load in a form of a transistor. Since, in the switching power supply, a large current flows through the switching element, it has been common to adopt a configuration in which the switching element is cooled by a cooler such as a radiator (for example, refer to patent documents 1 and 2). However, in a configuration in which a cooling device is provided in a form of a radiator, there has been a problem that the size of the entire electronic device is increased, which is contrary to a demand for downsizing of the electronic device. Patent Document 1: Japanese Patent Application Publication No. 2006-141336 Patent Document 2: Japanese Patent Application Publication No. 2004-189454Q: Python 3 - passing a variable in argv from main() I'm new to python. I have been trying to make a tty module for my project. I made a variable 'ttypass' which is a password. I am trying to set it so that 'ttypass' and whatever is put into argv is saved to the variable 'ttypass' but it seems to be overwrit
