Field of the Invention The
present invention relates to a
small-sized information
processing apparatus having a
touch panel. 2. Description of

the Related Art In general, a small-sized information processing apparatus has a flat touch panel or touch switch on a display panel. Such a touch panel is typically arranged on a frame of the information processing apparatus, in the vicinity of a display panel. The touch panel is used as a key input device for entering characters, numerals and the like. According to the prior art, the touch panel and the display panel are fixed to each other by a hinge, so that the touch panel and the display panel are swung by the hinge. However, in the prior art, the touch panel is relatively heavy and is large in

size because the hinge is formed in a predetermined shape. Thus, the hinge is readily deformed by an external force applied to the touch panel. In addition, when the display panel is relatively heavy, the hinge cannot be arranged in the vicinity of the display panel. Moreover, when the display panel is an organic EL display panel, the display panel is degraded in durability because the hinge or the display panel is exposed to an environment. A mechanistic investigation of methyl-(2-pyridyl) sulfoxide-induced cytotoxicity in cultured rat cardiomyocytes. The cyto- and geno-toxicity of

methyl-(2-pyridyl) sulfoxide (MPSO) is unclear. Here we report a mechanistic investigation of MPSO-induced cytotoxicity to cultured cardiomyocytes. Western blot analysis showed that MPSO elevated the levels of reactive oxygen species (ROS) and pro-apoptotic proteins Bax and p53, and reduced anti-apoptotic protein Bcl-2; these effects were associated with cell death. MPSO induced the cleavage of procaspase-9 and procaspase-3 and increased the generation of caspase-3 catalytic activity. These effects were associated with mitochondrial dysfunction evidenced by MPSO-induced

mitochondrial depolarization
